Static WCET analysis  
Quantifying pessimism  
Example: cache analysis  
Future work

$\mathcal{P}^T$  = all the CFG paths

$\mathcal{P}^+$  =  $\mathcal{P}^T$  - known-to-be-infeasible paths

$\mathcal{P}^r$  = really-feasible paths

*longest paths*

# "Static analysis overestimates WCET"

# "Static analysis overestimates WCET"

Static WCET analysis  
Quantifying pessimism  
Example: cache analysis  
Future work

*initial hardware state*

low-level  
analysis

WCET  
computation

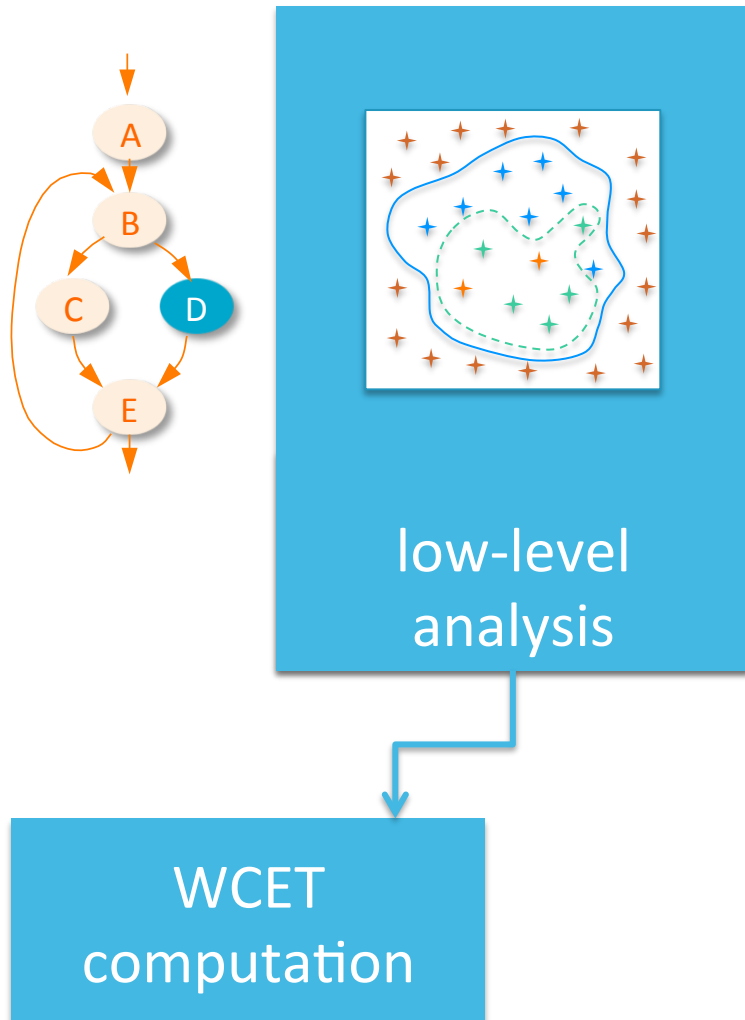

$\mathcal{H}^T$  = all the theoretically-possible states

$\mathcal{H}^+$  =  $\mathcal{H}^T$  – known-to-be-infeasible states

$\mathcal{H}^r$  = really-feasible states

# "Static analysis overestimates WCET"

Static WCET analysis  
Quantifying pessimism  
Example: cache analysis  
Future work

$C^T$  = all the theoretically-possible scenarios  
 $C^+$  =  $C^T$  – known-to-be-infeasible scenarios  
 $C^r$  = really-feasible scenarios

Static analysis determines local WCETs (basic blocks)

- abstracts (over-approximates) hardware states
- considers all "maybe-possible" scenarios

# Quantifying the pessimism of WCET estimates

Real WCET      $ET : \mathcal{H} \times \mathcal{P} \rightarrow \mathbb{N}$       $WCET = \max_{(h,p) \in \mathcal{H} \times \mathcal{P}} ET(h,p)$

Static WCET estimation      $WCET^\# : \mathcal{H} \times \mathcal{P} \times \mathcal{C} \rightarrow \mathbb{N}$

- upper bound on the WCET:

$$WCET^+ = \max_{(h,p,c) \in \mathcal{H}^+ \times \mathcal{P}^+ \times \mathcal{C}^+} ET(h,p,c)$$

$$WCET^r \leq WCET^+$$

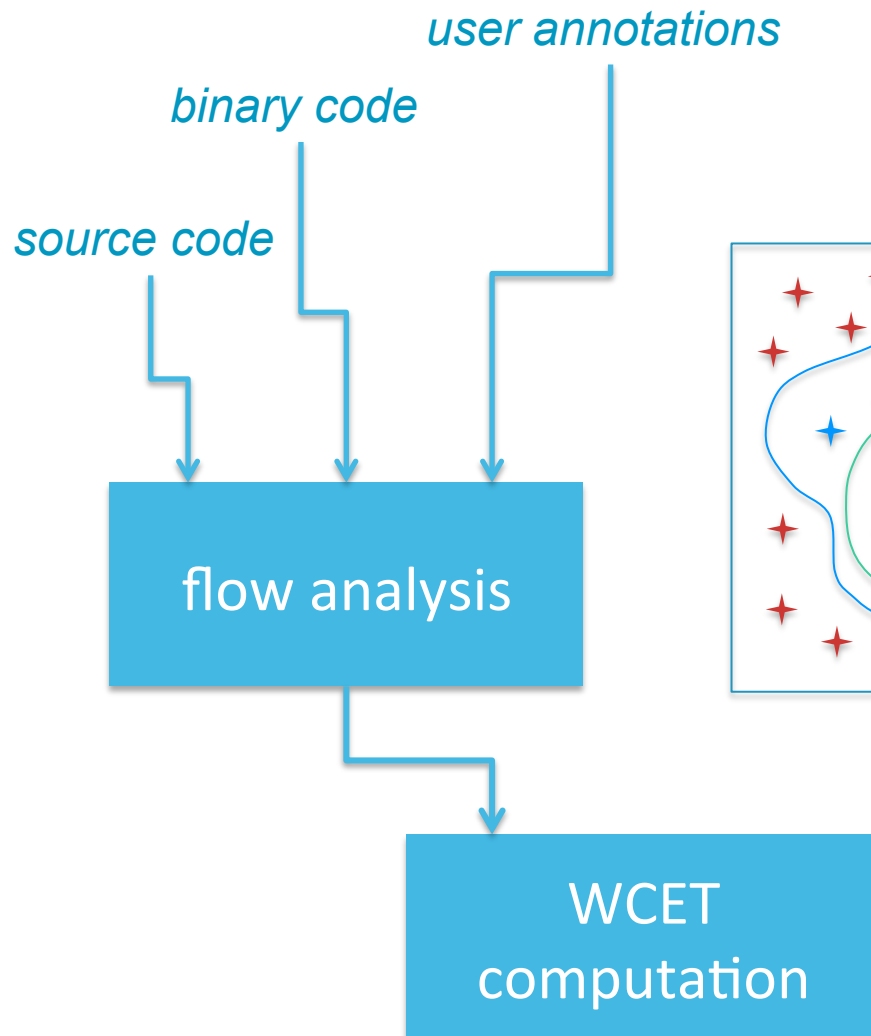

- lower bound on the WCET:

$$WCET^- \leq WCET^r \leq WCET^+$$

$$U = WCET^+ - WCET^-$$

# Quantifying the pessimism of WCET estimates

Static WCET analysis  
Quantifying pessimism  
Example: cache analysis  
Future work

$\mathcal{P}^T$  = all the CFG paths

$\mathcal{P}^+$  =  $\mathcal{P}^T$  - known-to-be-infeasible paths

$\mathcal{P}^r$  = really-feasible paths

$\mathcal{P}^-$  = known-to-be-feasible paths

# Quantifying the pessimism of WCET estimates

Static WCET analysis  
Quantifying pessimism  
Example: cache analysis  
Future work

*initial hardware state*

low-level  
analysis

WCET  
computation

$\mathcal{H}^T$  = all the theoretically-possible states

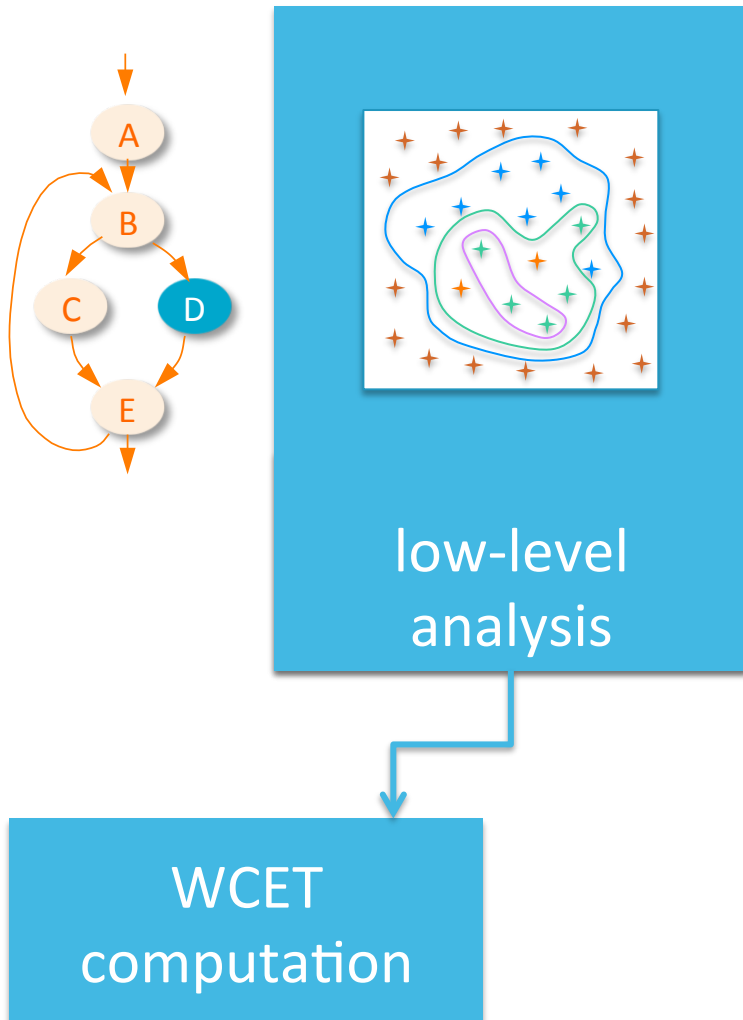

$\mathcal{H}^+$  =  $\mathcal{H}^T$  – known-to-be-infeasible states

$\mathcal{H}^r$  = really-feasible states

$\mathcal{H}^-$  = known-to-be-feasible states

# Quantifying the pessimism of WCET estimates

Static WCET analysis  
Quantifying pessimism  
Example: cache analysis  
Future work

$C^T$  = all the theoretically-possible scenarios

$C^+$  =  $C^T$  – known-to-be-infeasible scenarios

$C^r$  = really-feasible scenarios

$C^-$  = known-to-be-feasible scenarios

or scenarios that cannot produce an execution time that is longer than  $WCET^r$

# Quantifying the pessimism of WCET estimates

Real WCET  $ET : \mathcal{H} \times \mathcal{P} \rightarrow \mathbb{N}$   $WCET = \max_{(h,p) \in \mathcal{H} \times \mathcal{P}} ET(h,p)$

Static WCET estimation  $WCET^\# : \mathcal{H} \times \mathcal{P} \times \mathcal{C} \rightarrow \mathbb{N}$

- upper bound on the WCET:

$$WCET^+ = \max_{(h,p,c) \in \mathcal{H}^+ \times \mathcal{P}^+ \times \mathcal{C}^+} ET(h,p,c)$$

$$WCET^r \leq WCET^+$$

- lower bound on the WCET:

$$WCET^- \leq WCET^r \leq WCET^+$$

$$U = WCET^+ - WCET^-$$

$$WCET^- = \max_{(h,p,c) \in \mathcal{H}^- \times \mathcal{P}^- \times \mathcal{C}^-} ET(h,p,c)$$

# Example: pessimism of cache analysis

## Low-level analysis scenarios

- $C^T = \{mmm, mmh, mhm, mhh, hmm, hmh, hhm, hhh\}$
- $C^+ = \{hmm, hmh, hhm, hhh\}$
- $C^r = \{hmh, hhm, hhh\}$
- $C^- = \{hhh\}$

basic block

# Example: pessimism of cache analysis

## Experimental methodology

- hardware platform (model):
  - ✧ MPC5554-like pipeline
  - ✧ 4 KB, 4-way associative LRU instruction & data caches
    - infinite write buffer
- benchmarks from the TACLeBench collection (MediaBench)

benchmark	# accesses to I\$	# loads
cjpeg_jpeg6b_wrbmp	37,328	6,187
gsm	4,2319,41	895,605
gsm_decode	1,739,854	211,854
gsm_encode	2,378,890	681,917
h264dec_ldecode_block	11,942	1,802
h264dec_ldecode_macroblock	51,373	51,373

# Example: pessimism of cache analysis

## Experimental methodology

- hardware platform (model):
  - ✧ MPC5554-like pipeline
  - ✧ 4 KB, 4-way associative LRU instruction & data caches
    - infinite write buffer
- benchmarks from the TACLeBench collection (MediaBench)
- WCET analysis with the OTAWA toolset (WCET<sup>+</sup>)
  - ✧ we added the computation of WCET<sup>-</sup>

# Example: pessimism of cache analysis

## Global results (instruction + data caches)

benchmark	$U = (\text{WCET}^+ - \text{WCET}^-) / \text{WCET}^-$
cjpeg_jpeg6b_wrbmp	36.25%
gsm	161.95%
gsm_decode	96.33%
gsm_encode	216.00%
h264dec_ldecode_block	126.11%
h264dec_ldecode_macroblock	144.41%

# Example: pessimism of cache analysis

## Uncertainty of instruction cache analysis

- with pessimistic data cache analysis

benchmark	<i>PERS</i>	<i>NC</i>	$U_{i\$}$
cjpeg_jpeg6b_wrbmp	25.0%	5.1%	0.54%
gsm	34.9%	19.6%	2.36%
gsm_decode	38.4%	29.3%	1.83%
gsm_encode	31.5%	18.7%	2.29%
h264dec_ldecode_block	52.6%	18.8%	4.84%
h264dec_ldecode_macroblock	57.7%	1.8%	0.32%

# Example: pessimism of cache analysis

## Uncertainty of data cache analysis

- with pessimistic instruction cache analysis

benchmark	<i>PERS</i>	<i>NC</i>	<i>unknown @</i>	<i>U<sub>ds</sub></i>
cjpeg_jpeg6b_wrbmp	9.2%	46.1%	33.8%	35.29%
gsm	0.0%	55.8%	38.4%	66.25%
gsm_decode	0.0%	69.4%	52.6%	143.66%
gsm_encode	0.0%	51.7%	34.1%	190.01%
h264dec_ldecode_block	0.0%	80.5%	64.4%	82.51%
h264dec_ldecode_macroblock	0.0%	54.4%	22.1%	141.90%

# Summary

## Framework

- static analysis provides a guaranteed WCET upper bound (WCET<sup>+</sup>)
- we can compute a lower bound on the WCET (WCET<sup>-</sup>)
- the real WCET must be between WCET<sup>-</sup> and WCET<sup>+</sup>
  - ✧ uncertainty  $U = \text{WCET}^+ - \text{WCET}^-$

## Possible interpretations of U

- is my WCET estimation tight?
  - ✧ if not, it might be due to a poor analysis or to a poorly coded application
- how do two analyses of the same component compare?
- which parts of the application would deserve a more precise analysis?
