

# network-based analyses of transcriptomics data: new approaches to define cell signatures from tissue data

Prof Tom Freeman  
Systems Immunology Group,  
The Roslin Institute,  
University of Edinburgh

**tissues**

**Immune Cells**

**cells**

- What does the expression pattern of a gene tell you about its likely function?
- What is the difference between the expression profile of tissues and cells, and how does this reflect their different functions?
- How is their expression profile changed during disease? – disease classification, patient stratification, drug targeting

# mouse expression atlas

## data deconvolution

computational approaches that can identify specific signals within heterogeneous data signals

in our case identify transcriptional **signatures** of cells and pathways from mixed cell populations, i.e. tissue samples

where a **signature** is a module (cluster) of genes that are robustly coexpressed because they are specifically transcribed by a given cell type or coregulated as they encode proteins that are part of the same pathway or process

variation in clinical samples

*every sample is a little different*

# an expression atlas of human skin

## perturbation of gene signatures in disease

# immune microenvironment and cancer

growing interest in targeting the immune system in the treatment of cancer – the so called field of *immuno-oncology*

numerous immune targets/strategies being explored as therapeutic targets, e.g. PD1, CTLA4, TLRs, CCRs etc

how do we analyse the immune microenvironment of tumours and relationship to outcome or treatment?

## Immune Cell Gene Signatures for Profiling the Microenvironment of Solid Tumors

Ajit J. Nirmal<sup>1</sup>, Tim Regan<sup>1</sup>, Barbara B. Shih<sup>1</sup>, David A. Hume<sup>1,3</sup>, Andrew H. Sims<sup>2</sup>, and Tom C. Freeman<sup>1</sup>

### Aim

to derive robust immune gene signatures, that can be used to identify the presence and abundance of immune cells in a tissue (tumour) micro-environment from transcriptomics data

Ajit Johnson Nirmal

# derivation of markers

sort cells (usually from blood), sometimes cultured,  
then analyse expression

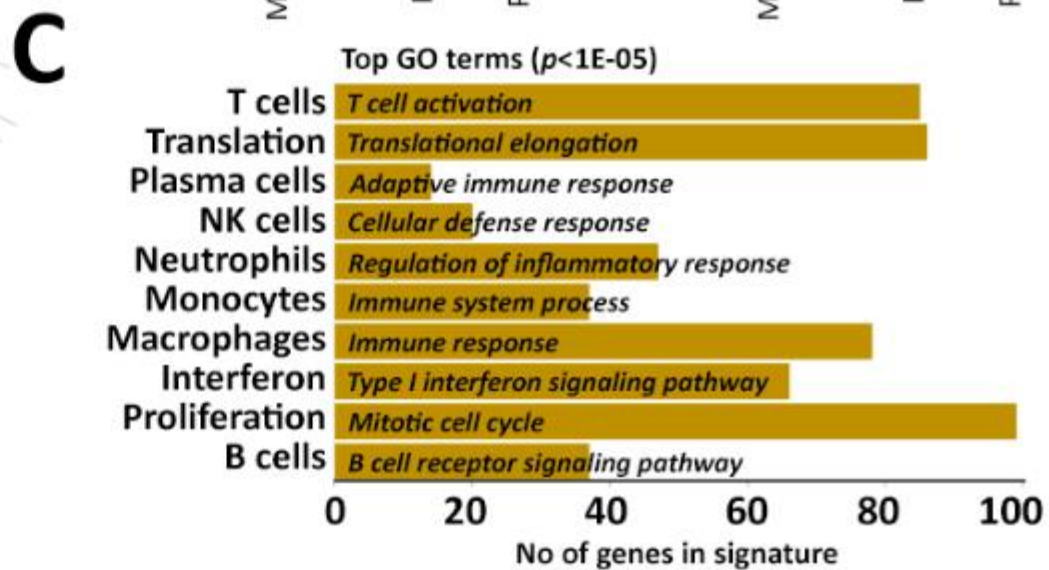

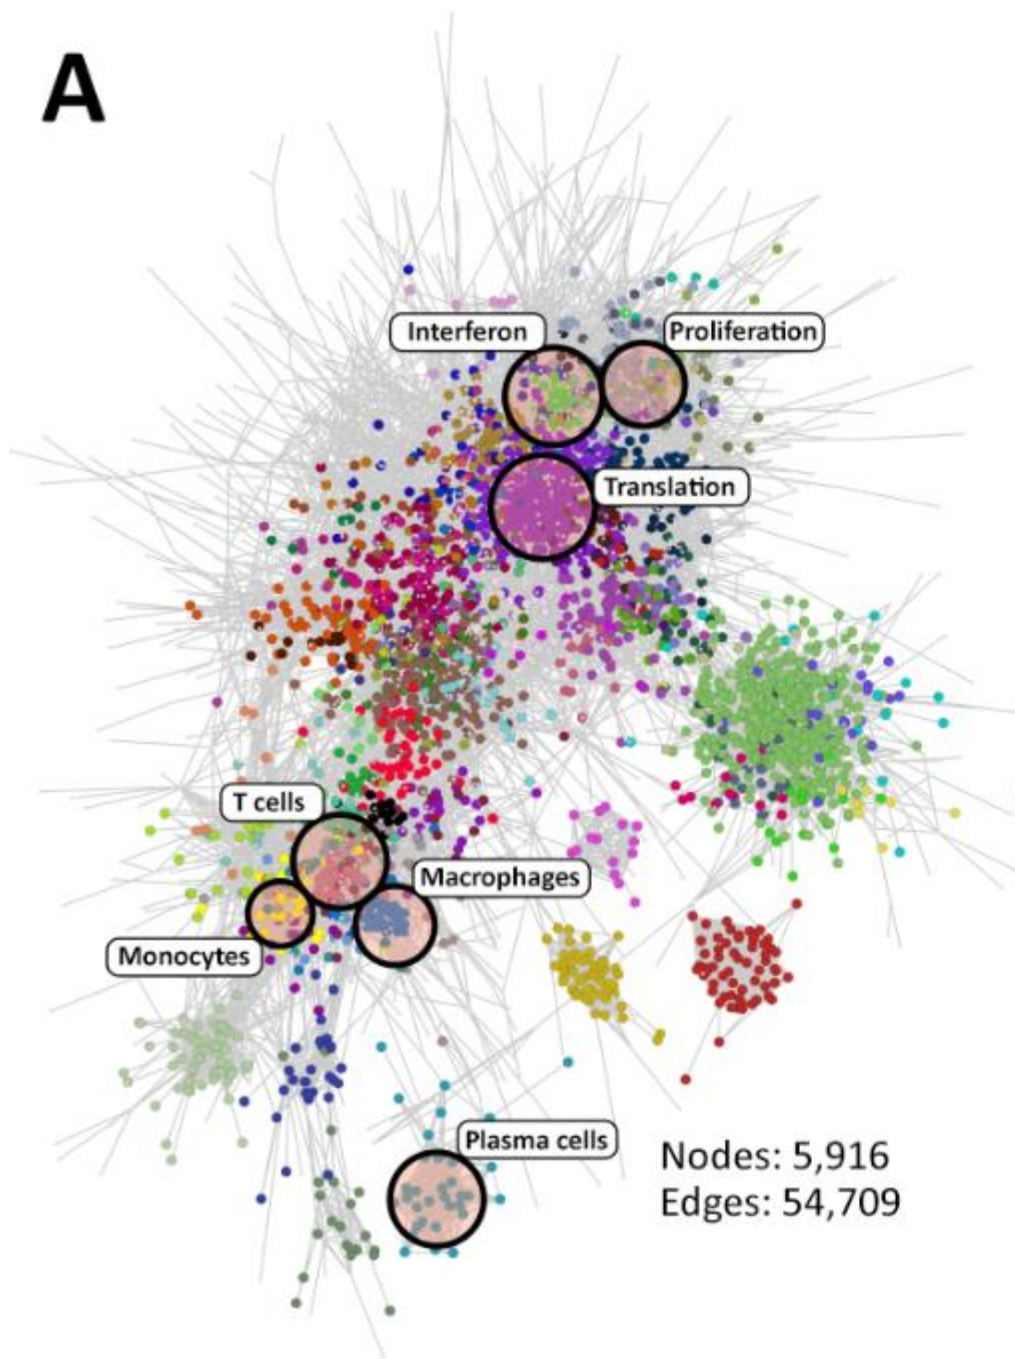

compare and derive cell type 'specific' markers

plugin into algorithm

## immune cell types and subtypes defined by published gene signatures

Study	Author, year (PMID)	Cell gene signatures (defined subtypes)	Unique genes

# pan-cancer hazard ratio analysis

# network analysis of melanoma datasets

# comparison of melanoma groupings

# grouping of melanoma patients

## Survival analysis

## summary

- gene correlation network analysis approach supports exploration of tissue data allowing the derivation of cell and pathway-specific gene signatures
- knowing what constitutes normal, tells you a lot about disease
- still poor understanding of how immune microenvironment varies between cancers – what does a ‘good’ microenvironment look like?
- what immune profile is most likely to respond to immunotherapy? Can we predict responders to a given treatment?
